

# Accounting Integration Settings

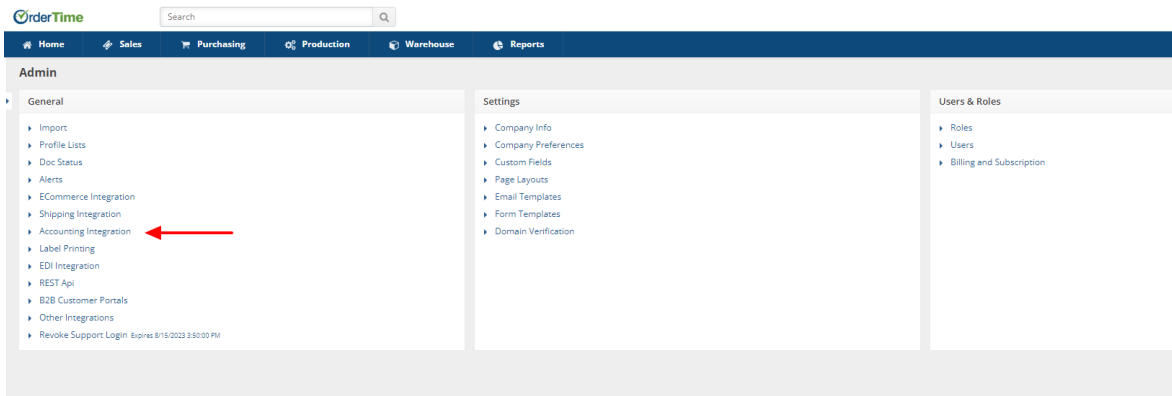

Last Modified on 10/21/2024 10:51 am EDT

## Overview

**Accounting Integration Settings** is where you configure how you want Order Time to integrate with your accounting system. Order Time integrates with QuickBooks Desktop, QuickBooks Online and XERO.

### QuickBooks Desktop Integration

- From the Admin screen select Accounting Integration in the General column towards the left hand side of the screen

- Selecting Account Integration will bring you to the Account Integration screen where you will be presented with the accounting systems available for integration.
- Select the green Activate button beneath the QuickBooks Desktop section.

- You will be presented with the Account Integration Settings screen
- There are 6 tabs each having their own configuration settings
  - Items
  - Customers

- Invoices
- Vendors
- Company
- Schedule

**Please pay particular attention to settings regarding payments, invoice dates and inventory valuations.**

## **Items**

The biggest decision you will make with the integration is whether you want to Sync Inventory (Parts and Assemblies) with your accounting system. Most accounting systems support inventory items and Order Time can both manage these items and include them in transactions. However, in certain circumstances, you may not want to synchronize inventory for a variety of reasons. The most common of which are as follows:

1. **The number of items you have exceeds your accounting system's limitation.**
2. **The valuation method used by your accounting system is not suitable for your purposes.**
3. **Inventory items cause bloat, speed or corruption issues in your accounting system.**
4. **You want to manually establish your inventory valuation (and by extension your Cost of Goods Sold - COGS)**

There are two questions that arise if inventory is **NOT** synced:

1. What items are used to post transactions in your accounting system?
  - Order Time will use a "**Proxy**", which is a non-inventory item used in place of the

inventory item when posting transactions into your accounting system.

- For example, this **invoice** uses a proxy item called *Books* in the accounting system. Notice the actual item number (sku) is in the description. This is generally not an issue, as you can send to your customers an **invoice from Order Time**, which will list the actual items. By default Order Time will create a proxy called OT Proxy.

2. How is COGS (Cost of Goods Sold) calculated?

- Each accounting system has its own way of calculating COGS.
- For example QuickBooks Desktop generally uses average cost when recording inventory items. However, when inventory is not synced, there would be no COGS entry. If you choose to Post valuation entries, Order Time will create a journal entry reflecting the appropriate inventory and COGS ledger entries.

When you check **Do Not Sync Inventory**:

- **Import existing inventory items**: check if you want to import existing inventory items.
  - **Note: this will occur during the initial sync only.**
- **Post valuation entries**: check if you want Order Time to post journal entries as described above.

- **After initial import, do not continue to synchronize addresses:**
  - After the initial import, you can stop syncing the billing and shipping addresses. This was added to avoid certain versions of QuickBooks of changing non-US addresses when address verification is turned on. We recommend that you keep this unchecked.
- **Synchronize credit card information:**
  - Check if you want Order Time to sync custom credit card information into your accounting system. This will be a one way sync as Order Time is unable to import Credit Card #'s due to compliance standards.
- **Invoice Send Method:**
  - This is used by QuickBooks. When a invoice is synced, QuickBooks will add it to the to be printed list or to be emailed list.

General

Use billing contact as default shipping contact

After initial import, do not continue to synchronize addresses

After initial import, do not continue to synchronize customer notes

Synchronize credit card information

Synchronize price levels

Customer Class Syncing is enabled

Invoice Send Method: None

Mapping

Order Time Field	Accounting Field	Action

If your accounting system supports custom fields for Customer then you can **map** your accounting custom fields to Order Time fields. **NOTE:** for QuickBooks Online, the custom fields mapped must be the one of the first three in the list.

## Invoices

The Ship Doc is the source for the *Invoice* in your accounting system and the Customer Return is the source for the *Credit Memo* in your accounting question. The first two settings relate to the timing of when Order Time should queue up these transactions to be synced. This is done by selecting the appropriate **document status** as the trigger point.

Invoice Date in Accounting is by default set to the *Posting Date* which is the date the ship doc's status was changed to Shipped. If you want to use the Ship Doc Date instead check - **Use Ship Doc's Date as Invoice Date** (by default Ship Doc's Posting Date is used).

**Payment:** By default, Order Time will sync payments collected in Order Time to your accounting system and vice versa. To prevent this check the appropriate setting.

If your accounting system supports Invoice and/or Invoice Line Item custom fields, then you can **map** your accounting custom fields to Order Time fields.

Accounting Integration Settings

Mapping - Line Items

Order Time Field	Accounting Field	Action

**Order Time will attempt to use the same Doc No. for imported Sales Orders and Purchase Orders when they are numeric and have not already been used.**

Vendors

The Receiver is the source for the *Bill* in your accounting system and the Vendor Return is the source for the *Debit Memo* in your accounting question. The first two settings relate to the timing

of when Order Time should queue up these transactions to be synced. This is done by selecting the appropriate **document status** as the trigger point.

The screenshot shows the OrderTime web interface. At the top is the OrderTime logo and a search bar. Below is a navigation menu with Home, Sales, Purchasing, Production, Warehouse, and Reports. The breadcrumb trail is Admin > Accounting Integration > Integration Settings. The main heading is Accounting Integration Settings, with tabs for Items, Customers, Invoices, Vendors (selected), Company, and Schedule. Under the Vendors tab, there is a General section with the following settings: Post Receiver as (radio buttons for Bill and Item Receipt, with Bill selected), Post Receiver when Status is (dropdown menu set to Received), Post Vendor Return when Status is (dropdown menu set to Returned), and For linked POs, include Customer;Job on Bill or Item Receipt (checkbox, unchecked). Below the General section is a Mapping section with a table:

Order Time Field	Accounting Field	Action

If your accounting system supports Vendor custom fields then you can **map** your accounting custom fields to Order Time fields.

## Company

Syncing Company Information shares the information with Order Time when it syncs with your accounting system. Entities are synced bidirectionally, meaning that changes can be made in either program.

When scheduling is set for the first time a sync will occur immediately.

The Order Time accounting integration with QuickBooks Online only supports PLUS & ADVANCED plans at this time.

It **DOES NOT** support Simple Start or Essentials.
